## Independent Sets

### Assignment Project Exam Help

- **IS:** Given an undirected graph  $G = (V, E)$  an independent set is a subset of nodes  $U \subseteq V$  such that no nodes in  $U$  are adjacent.
- **MIS:** An independent set is maximal if no node can be added without violating independence.
- **MaxIS:** An independent set of maximum size is called maximum.

## Independent Set (IS)

### Assignment Project Exam Help

- An IS is a set of nodes of the graph such that no two nodes are adjacent. em
- We also have maximal and maximum independent sets.

Add WeChat edu\_assist\_pro

### Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

- Every MIS (Maximal Independent Set) is a dominating set.
- In general, the size of every MIS can be larger than the size of an optimal minimum dominating set by a factor of  $\Omega(n)$ .<sup>a</sup>

---

<sup>a</sup>We won't prove this here.

<https://eduassistpro.github.io/>

## Coloring and Independent Sets

### Assignment Project Exam Help

- **Example 1** Graph has two independent sets (MIS), but only one is a maximum independent set (IS).

## Coloring and Independent Sets

### Assignment Project Exam Help

- There is a relation between independent node coloring:
  - each color class is an independent

Add WeChat edu\_assist\_pro

### Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

- however, it is not necessarily a MIS.

<https://eduassistpro.github.io/>

## From Coloring to Independent Sets Assignment Project Exam Help

- Starting with a coloring, one can find a maximal independent set by the following algorithm:
  1. We first choose all nodes of the first color.
  2. Then, for each additional color we add “in parallel” (without conflict) as many nodes as possible.

## From Coloring to Independent Sets: Analysis

### Assignment Project Exam Help

- **Theorem 1** *Given a coloring  $\phi$  of  $G$  that uses  $C$  colors and runs in time  $T$ , we can decide if  $G$  has an independent set of size  $k$  in time  $C + T$ .*
- Time complexity:
  - the  $T$  in the time complexity comes from the coloring algorithm, and
  - the  $C$  in the time complexity is the number of colors.

### Related Topic: Set Cover (SC)

#### Assignment Project Exam Help

- Given a set of elements  $U$  (called the universe) and a collection  $S$  of  $m$  sets whose union equals the universe, the set cover problem is to identify the smallest sub-collection of  $S$  whose union equals the universe.

- For example, consider the universe  $U = \{1, 2, 3, 4, 5\}$  and the collection  $S = \{\{1, 2, 3\}, \{3, 4\}, \{4, 5\}\}$ .

Clearly the minimum set cover must contain all of the elements with the following, smallest sub-collection:  $\{\{1, 2, 3\}, \{4, 5\}\}$ .

- A company needs to buy a certain amount of varied supplies and there are suppliers that offer various deals for different combinations of materials (Supplier A: 2 tons of steel + 500 tiles for  $\$x$ ; Supplier B: 1 ton of steel + 2000 tiles for  $\$y$ ; etc.). You could use set covering to find the best way to get all the materials while minimizing cost.

<https://eduassistpro.github.io/>

Issues

## Assignment Project Exam Help

- Computing a maximum independent set (MIS) is a notoriously difficult problem.
  - Equivalent to maximum clique on the complementary graph.
  - Both problems are NP-hard, in fact not approximable within  $n^{1/2}$ .
- MIS and MaxIS
  - On a star graph MIS is  $\Theta(n)$  and MaxIS is  $\Theta(1)$ .

## Computing MIS

### Assignment Project Exam Help

- Computing a MIS sequentially
  1. Scan the nodes in arbitrary order
  2. If a node  $u$  does not violate independence,
    - add  $u$  to the MIS.
  3. If  $u$  violates independence,
    - discard  $u$

**Algorithm: Lexicographic  $MIS(G)$**

Assignment Project Exam Help

- Previous algorithm sometimes works. Consider a graph  $G = (V, E)$  in which the vertices are lexicographically ordered.

1:  $I = \emptyset, V' = V$

2: **while**  $V' \neq \emptyset$  **do**

3:     Choose

4:      $I \leftarrow I \cup$  <https://eduassistpro.github.io/>

5:      $V' \leftarrow V' \setminus (\{v\} \cup N(v))$   
Add WeChat edu\_assist\_pro

6: Return  $I$ ;

- With this simple greedy algorithm, we can find a MIS in  $O(|V| + |E|)$  time.
- The main question is how to compute a MIS in a distributed manner.

## Distributed Slow MIS

### Assignment Project Exam Help

- Main idea is to give priority to nodes.
- Slow MIS
- Requires Node IDs
- Every node  $v$  executes the following code:
  1. **if** all neighbors  $u$  have decided not to join the MIS **then**
  2.  $v$  decides to join the MIS
  3. **end if**

Complexity

## Assignment Project Exam Help

- **Theorem 2** *Algorithm Sl* *mplexity of  $O(n)$*   
and a message complexity of
- Slow MIS is not better than the sequential algorithm in the worst case, because there might be one single point of activity at any time.

Add WeChat edu\_assist\_pro

<https://eduassistpro.github.io/>

Issues

## Assignment Project Exam Help

- Using Theorems 1 and 2 we get a deterministic MIS algorithm for cycles (also for tre degree graphs) with time complexity  $O(\log^* n)$  (will cover this later in class).
  - First do the colouring in  $O(\log^* n)$  rounds.
  - Choose all nodes of the first color.
  - For each additional color, choose a set of nodes (no conflict) as many as possible.
- With a lower bound argument one can show that any deterministic MIS algorithm for rings is asymptotically optimal.
  - Because in the ring MIS is “essentially” the same as coloring.
- There have been attempts to extend the 6-Color Algorithm to more general graphs, however, so far without much success.

<https://eduassistpro.github.io/>

### Is There a Faster Algorithm?

#### Assignment Project Exam Help

- Given that “Slow MIS” is not best algorithm in the worst case  
– Is there a faster MIS?
- In the sequel we give a probabilistic algorithm with  $O(\log n)$  expected termination time.

**Goal: Find a parallel MIS algorithm**

Assignment Project Exam Help

- Consider algorithms of the for

1.  $I = \emptyset, V' = V$

2. While  $G'$  is not the empty graph

(a) Choose a random set of vertices  $S \subseteq V$  by selecting each vertex  $v$  independently with probability  $\frac{1}{d_v}$ , where  $d_v$  is the degree of

(b) For every edge  $(u, v)$  if both  $u$  and  $v$  points are in  $S$ , then remove the vertex of lower degree from  $S$  (break ties). Denote the set after this step as  $S'$ .

(c) Remove  $S'$  and  $Neighbor(S')$  and all adjacent edges from  $G'$ .

(d)  $I \leftarrow I \cup S'$

<https://eduassistpro.github.io/>

## Distributed Fast MIS<sup>a</sup>

### Assignment Project Exam Help

- Algorithm operates in synchronous rounds grouped in phases.
- A single phase is as follows:

Add WeChat edu\_assist\_pro

1. Each node  $v$  marks itself with probability  $\frac{1}{2d(v)}$ , where  $d(v)$  is the current degree of  $v$ .

### Assignment Project Exam Help

- 2(a) If no higher degree neighbor of  $v$  is also marked, node  $v$  joins the MIS.

<https://eduassistpro.github.io/>

- (b) If a higher degree neighbor of  $v$  is also marked, node  $v$  unmarks itself again.

Add WeChat edu\_assist\_pro

/\* If neighbors have same degree, ties broken by ID \*/

3. Delete all nodes that joined the MIS and their neighbors /\* as they cannot join the MIS anymore. \*/

---

<sup>a</sup>A more general form of this algorithm assigns real numbers (in the range  $[0, 1]$ ) as weights at the nodes. An alternative version is to label the vertices with a random permutation.

<https://eduassistpro.github.io/>

Issues

## Assignment Project Exam Help

- Correctness in the sense that the algorithm uses an independent set is relatively simple.
  - Steps 1 and 2 make sure that if a node  $v$  joins the MIS, then  $v$ 's neighbors do not join the MIS at the same time.
  - Step 3 makes sure that  $v$ 's neighbors will never join the MIS.
- The algorithm ensures that the node with the highest degree will mark itself at step 1.
- The only remaining question is how fast it terminates.
  - This is not easy to figure out!

<https://eduassistpro.github.io/>

Exercises<sup>a</sup>

## Assignment Project Exam Help

1. Show that any maximal matching is a maximum matching.
2. Let  $G = (V, E)$  be the graph for which we want to construct the matching. Define the auxiliary graph  $G'$  as follows:
  - for every edge in  $G$  there is a node in  $G'$ ;
  - two nodes in  $G'$  are adjacent if their respective edges in  $G$  are adjacent.

Show that a (maximal) independent set in  $G'$  is a (maximal) matching in  $G$ , and vice versa.
