Coloring Algorithm for Vertex v Assignment Project Exam Help

- Assume an ordering of the vertices (we will do).

- Coloring Algorithm:

Assignment Project Exam Help

1. $c_v \leftarrow id_v;$

2. Repeat: <https://eduassistpro.github.io/>

(a) $\ell \leftarrow |c_v|;$

(b) if v is “leftmost vertex” then set

else set $I \leftarrow \min\{i : c_v(i) \neq c_{prev}(i)\};$

(c) Set $c_v \leftarrow I_{c_v}(I); /*$ concatenation */

(d) Inform the successor $suc(v)$ of v of this choice;

3. Until $|c_v| = \ell; /*$ Until length does not change */

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- Given two nodes $u \rightarrow v$.
- Lets show how the color of node v changes from the old color c_v to a new color c_v' .

– A similar change occurs to the color of u , but this is influenced from the predecessor of u .

- Let their current colors be c_u and c_v .
 $\xrightarrow{u \rightarrow v}$
- Convert to binary:
 $c_u = 512 + 64 + 16 + 2 = 2^9 + 2^6 + 2^4 + 2^1$
 $c_v = 512 + 64 + 32 + 16 + 4 + 2 + 1 = 2^9 + 2^6 + 2^5 + 2^4 + 2^2 + 2^1 + 2^0$
- $c_u = 1001010010$ and $c_v = 1001110111$

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- Consider the two nodes with col

Add WeChat edu_assist_pro

$$c_u = 1001010$$

$$v = 1001110111$$

- What is the smallest i such that $c_u(i) \neq c_v(i)$?

Assignment Project Exam Help

- Line up the bits

<https://eduassistpro.github.io/>

Add WeChat[↑]edu_assist_pro

1001110111

- So $i = 4$ (counting starts from 0); in binary 4 is 100 and the new colour of v in binary representation is

$$ic_v(i) = 1001 = 9$$

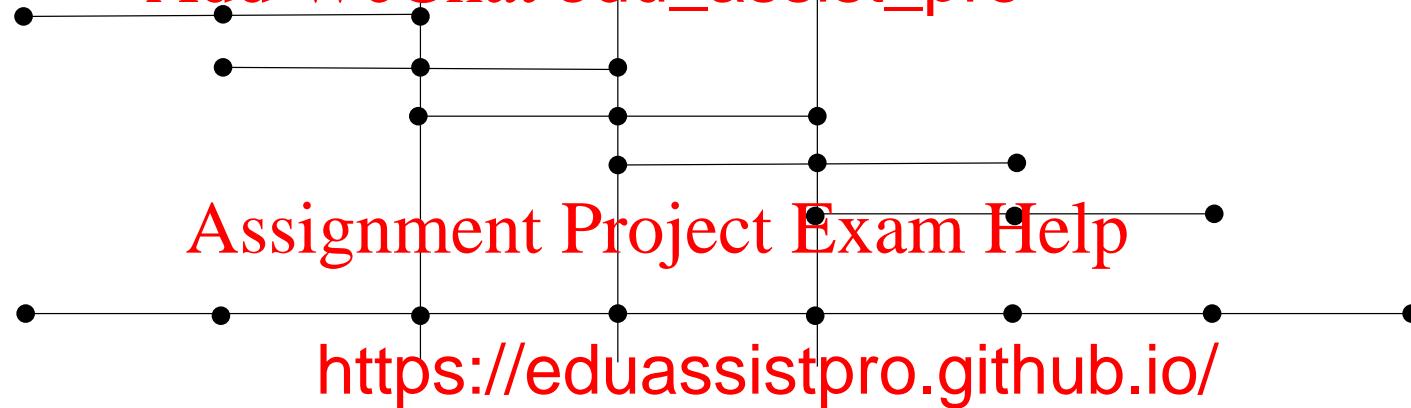

<https://eduassistpro.github.io/>

Execution of Coloring Algorithm

- A node receives input from its pre

Add WeChat edu_assist_pro

- ...and provides input to its successor.

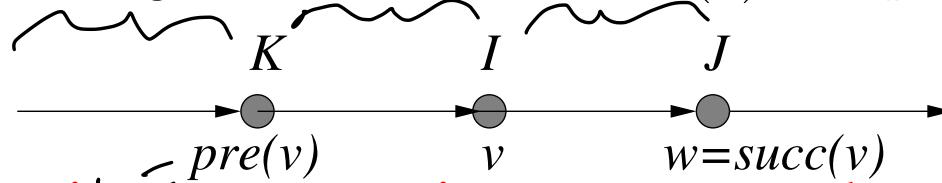

Add WeChat edu_assist_pro

$\log^* n$

<https://eduassistpro.github.io/>

Correctness: Legal Coloring (1/2)

- Consider three consecutive nodes u, v, w at some iteration of the algorithm with $ev(v), v = pre(w)$.

[Assignment Project Exam Help](https://eduassistpro.github.io/)

- Let I, J be the in $\text{p 2(b), respectively.}$
 - $I := \min\{i : \forall j < i . c_v(j) \neq c_w(j)\}$
 - v, w receive the new colours:

$$c_v \leftarrow I c_v(I)$$

and

$$c_w \leftarrow J c_w(J)$$

<https://eduassistpro.github.io/>

Correctness: Legal Coloring (2/2)

Assignment Project Exam Help

- We need to show that $Ic_v(I) \neq Ic_w(I)$.
Add WeChat edu_assist_pro
- There are two cases to consider:
 1. If $I \neq J$ then rule 2(b) ensures that the new labels $Ic_v(I), Ic_w(J)$ as defined in 2(c) differ in a bit
– because I, J do
Assignment Project Exam Help
 2. If $I = J$ then $Ic_v(I) \neq Ic_w(I)$ as defined in 2(c) differ in the last bit
 - Recall that $c_u(I) \neq c_v(I)$ and $c_u(I) \neq c_w(I)$
Add WeChat edu_assist_pro
 - Since $I = J$ we have that $c_u(I) \neq c_v(I)$ and $c_v(I) \neq c_w(I)$
 - The new labels for v, w will be $Ic_v(I)$ and $Ic_w(I)$ and by choice of I we have that $c_v(I) \neq c_w(I)$.

<https://eduassistpro.github.io/>

Assignment Project Exam Help

Number of Rounds 5

- At the start, $K_0 = K = \frac{x}{n^5}$ number of bits of a node in the original ID coloring. $\log n : n^5$

- Let K_r denote the number of bits in the color representation after the r th iteration.

r-th iteration c_v
 $\forall i \in S \in [\log K_r] + 1$

- Observe that

- Therefore the size of the colors is roughly $\log \log \log n$ bits, the third of roughly $\log \log \log \log n$, etc.

- As a matter of fact the “sizes of the colours” shrink very rapidly!
 - The size of the colour (measured in bits) in the new step is the logarithm of the size of the colour in the previous step!

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- $\log^* n$ is not really a logarithm
 - it is rather the number of iterations on a number n until it stops having an effect!
- Log-Star (in base 2) of n :
 - Is the number of 1s starting from <https://eduassistpro.github.io/>
- Can be defined in any base! Here we look only

$$\begin{aligned}
 15 & \\
 \log 15 &+ 1 = 5 \\
 \log 5 &+ 1 = 4 \\
 \log 4 &+ 1 = 3
 \end{aligned}$$

log 3
 log 2
 log 1

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- Iterated Definition of

- $\log^{(1)} n = \log n$, and
- $\log^{(x+1)} n = \log(\log^{(x)} n)$, for $x \geq 1$.

Then $\log^* n =$ first integer x such that $\log^{(x)} n < 2$. ^a

- Recursive defi

<https://eduassistpro.github.io/>

$$\log^* x = \begin{cases} 1 & \text{if } x \leq 2 \\ 1 + \log^* x & \text{if } x > 2 \end{cases}$$

^a $\log^{(x)} n$ should not be confused with $\log^x n$: the logarithm to the power x .

<https://eduassistpro.github.io/>

Assignment Project Exam Help

- Log-star is a very slowly growing function
- Consider the number n

$$\log(2^{2^5}) = 2^5$$

<https://eduassistpro.github.io/>

$\log(2^{2^5}) \leq 5$

<https://eduassistpro.github.io/>

$$\log(2.32) < 2.$$

[Add WeChat edu_assist_pro](https://eduassistpro.github.io/)

Hence, $\log^*(2^{2^5}) = 4$.

- Log-star of all the atoms in the observable universe (estimated to be 10^{80}) is 5.

<https://eduassistpro.github.io/>

The Starting Nodes: Something Wrong? Assignment Project Exam Help

- Recall the leftmost node was given by the identities of the nodes “located” at the beginning of the line are reduced to constant size.
- It is not clear from the description why the identities of the nodes “located” at the beginning of the line are reduced to constant size.
 - By beginning we mean the first $O(\log^* n)$ nodes.
- Observe that the first $O(\log^* n)$ nodes are indeed reduced to constant size.
- Can remedy this by adding an additional step at the end of the algorithm:
 - The first $O(\log^* n)$ nodes run a recoloring algorithm to reduce their colors to constant size.
 - Note that this step takes additional time $O(\log^* n)$.

<https://eduassistpro.github.io/>

Six Coloring in $\log^* n$ Iterations Assignment Project Exam Help

- If K_i = number of bits in the color
 - $K_{r+1} = \lceil \log K_r \rceil + 1$.
 - $K_{r+1} < K_r$ as long as $K_r \geq 4$.

[Assignment Project Exam Help](https://eduassistpro.github.io/)

- Therefore in the final iteration r we have that $K_r = K_{r-1} \leq 3$.

- at most three choices for the coloring, and

<https://eduassistpro.github.io/>

- two choices for the value of the bit, which gives a total of six colors.

- It turns out,

- we can improve on # of colors from six to three, but we probably can do it in 3!

i iterations then

$$\text{if } x \geq 4$$

$$1 + \lceil \log x \rceil < x$$

$$K_r \leq 3$$

$r - 1$ st

Can color the line in 6 colors. But

mixed

Analysis of Six2Three Assignment Project Exam Help

- Theorem 5 (Analysis of Algorithm Six2Three colors a graph in time $O(\log^* n)$).
Add WeChat edu_assist_pro
- Each vertex colored x will find an available color from the set $\{1, 2, 3\}$, **Assignment Project Exam Help**
 - since by the Shift Theorem, <https://eduassistpro.github.io/> n colors are occupied, one less than the number of vertices.
- Now note that recoloring the x 's simultaneously creates no problem since they are all mutually nonadjacent.

<https://eduassistpro.github.io/>

Optimality Assignment Project Exam Help

- Fast tree-coloring with only 2 colors exponentially more expensive than coloring
 - In a tree degenerated to a line, nodes far away need to figure out whether they are an even or odd number of hops away from each other in order to get a 2-coloring.
 - To do that one has to traverse the entire line

Can anything be better than $\log^* n$? Assignment Project Exam Help

- The only thing better than $\log^* n$ running time is $O(1)$ running time! [Add WeChat edu_assist_pro](#)
 - A 2-coloring is possible with $O(1)$ running time in a distributed system with GPS!
- It turns out that we can prove a lower bound of $\Omega(\log^* n)$ on the time required to <https://eduassistpro.github.io/> by three colors.
 - This implies a tight bound of $\Theta(\log^* n)$ time required for 3-coloring the line (ring).

<https://eduassistpro.github.io/>

$\Omega(\log^* n)$ Lower Bound Assignment Project Exam Help

- **Theorem 6** Every determined algorithm to color a directed ring with 3 or more nodes needs at least $(\log^* n)/2 - 1$ rounds.
- The proof uses a theorem of Frank P. Ramsey.

Generalizations and Additional Results Assignment Project Exam Help

- Linial (1992) proves that
 - in rooted d -regular tree $T_{d,r}$, any synchronous distributed algorithm running in time $\leq \frac{2}{3}r$ cannot color $T_{d,r}$ by fewer than $\frac{1}{2}\sqrt{d}$ colors.
 - an arbitrary graph G of order n and max degree Δ , can be colored with 5 colors distributively.
 - for G labeled, in time $O(\log n)$ color G with $O(\Delta^2)$ colors in a distributive algorithm.
- There exists a deterministic distributed algorithm for coloring arbitrary graphs with max degree Δ ;
 - can be colored with $\Delta + 1$ colors in $O(\Delta \log^* n)$ time.
