Add WeChat edu\_assist\_pro

Assignment Project Exam Help

S <https://eduassistpro.github.io/> S

Add WeChat edu\_assist\_pro

<https://eduassistpro.github.io/>

## Motivation: Shortest Paths Assignment Project Exam Help

- Consider a strongly connected graph, with unidirectional communication.
- BFS finds shortest path with the hop distance. How do we generalize BFS?

- Assume that each (un)directed edge has an associated nonnegative

<https://eduassistpro.github.io/> distance

Add WeChat edu\_assist\_pro

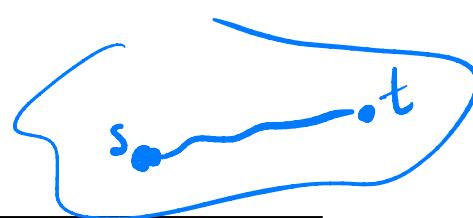

between  $u$ ,  $v$   
is the number  
of hops from  
 $u$  to  $v$

- The weight of a path is the sum of the weights on its edges.

<https://eduassistpro.github.io/>

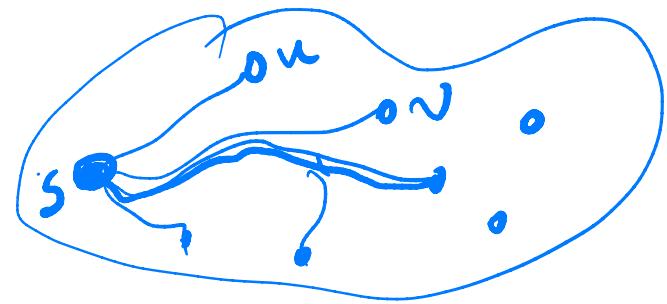

## Shortest Path Problem Assignment Project Exam Help

- Problem: find a shortest path from a fixed source node to every other node, where
  - a shortest path is a path with minimum weight.
- A collection of shortest paths from the source to all the other nodes in the digraph constitutes a subtree of the digraph, all of whose edges are oriented towards the source node.
  - Does the collection of shortest paths from a fixed source node in an undirected graph form a tree? (Consider a bidirectional ring of  $n$  nodes.) How about if the edge weights are pairwise different?<sup>a</sup>

---

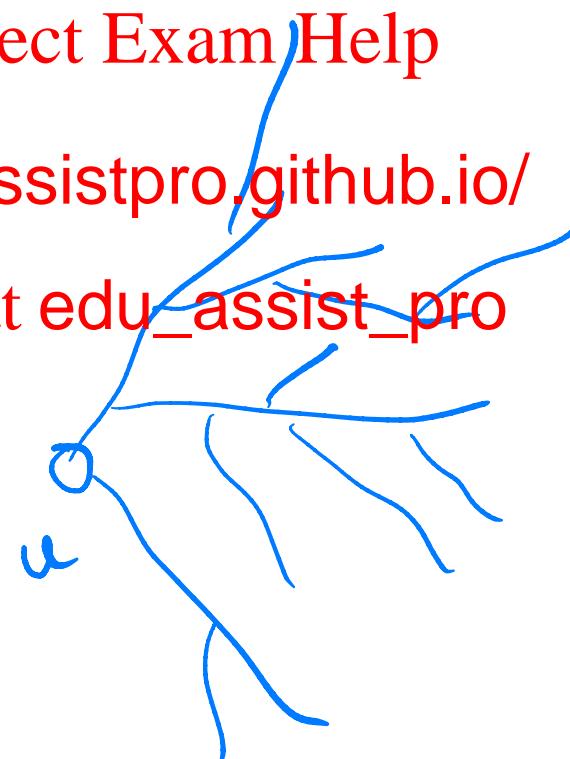

<sup>a</sup>Why?

<https://eduassistpro.github.io/>

## Applications: Shortest Paths Assignment Project Exam Help

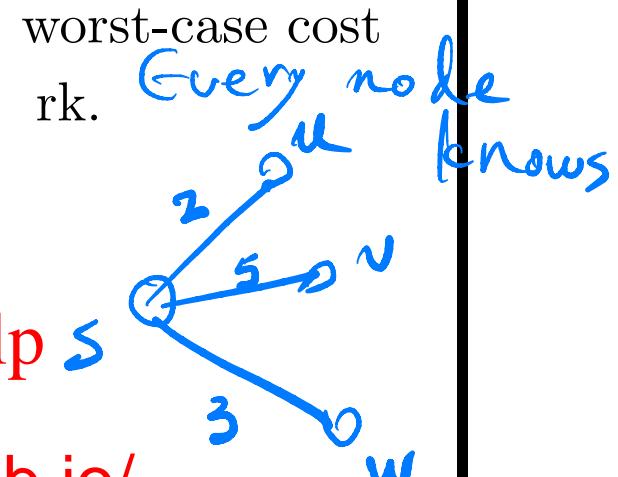

- Motivation for constructing shortest paths comes from the desire to have a convenient structure for communication.
- Weights represent costs associated with the traversal of edges, for instance,
  - communication delay,
  - bandwidth, <https://eduassistpro.github.io/>
  - monetary charge

<https://eduassistpro.github.io/>

## Shortest Paths' Trees (SPTs) Assignment Project Exam Help

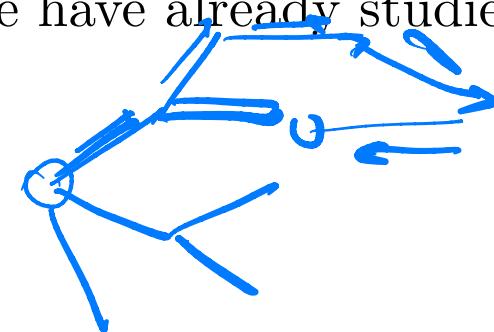

- A shortest paths' tree minimizes the cost of communicating with any process.
- We assume that every process initially knows
  1. the weight of all its incident edges.
  2. the number of processes in the network.
- We require that each process maintains
  1. its parent in a particular shortest path.
  2. its distance (i.e., the total weight of its shortest path) from the source.

<https://eduassistpro.github.io/>

## Construction of BFS Assignment Project Exam Help

- If all edges are of equal weight, the shortest paths tree.  
– a trivial modification of the simple SynchBFS tree construction can be made to produce the distance information as well as the parent pointers.
- In synchronous systems there is a simple yet efficient method to do this.  
– in asynchronous systems the spanning tree produced by the flooding algorithm may be far from BFS.
- In standard BFS constructions (that we have already studied) all edges have weight 1.

<https://eduassistpro.github.io/>

## Construction of BFS (with weights) Assignment Project Exam Help

- A classic BFS construction is
  - Dijkstra's Algorithmand can be a synchronous/asynchronous algorithm

## Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

<https://eduassistpro.github.io/>

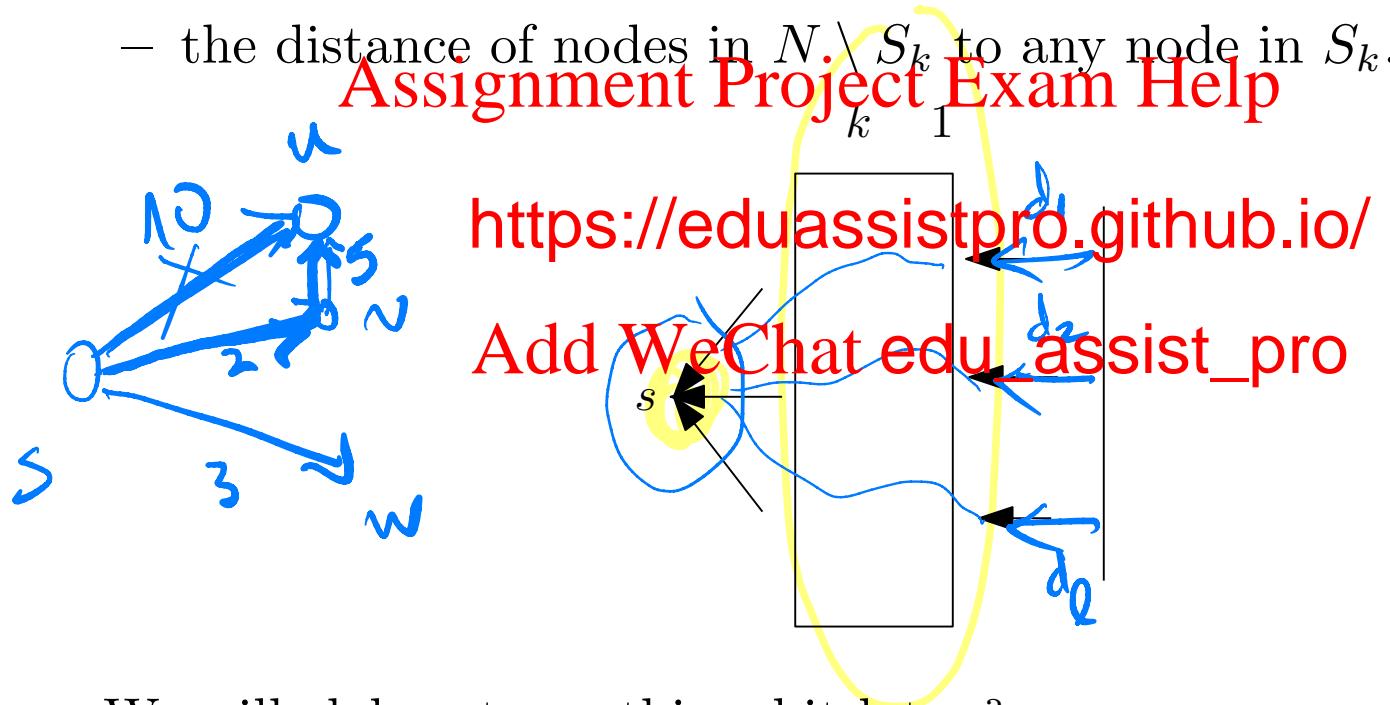

## Dijkstra's Algorithm and Relaxation Assignment Project Exam Help

- Based on the principle of
  - An approximation to correctly replace by more accurate values until reaching the optimum solution.
  - Approximate distance to each vertex is an overestimate of true distance.
  - Replaced by  $\text{approx\_dist}(u) \leq \text{approx\_dist}(v)$  newly found  $v$
- Greedily selects a node “corresponding to” that has not yet been processed, and performs this relaxation process on all of its outgoing edges.
- Processing (usually done with a heap) which also counted as part of the cost

<https://eduassistpro.github.io/>

## Basic Idea of Constructing Shortest Paths Assignment Project Exam Help

- Let  $S_k$  be the set of  $k$  nodes closest to the destination  $s$ .
- During the  $k$ th step the node closest to the destination  $s$  is found by considering
  - the distance of nodes in  $N \setminus S_k$  to any node in  $S_k$ .

- We will elaborate on this a bit later.<sup>a</sup>

---

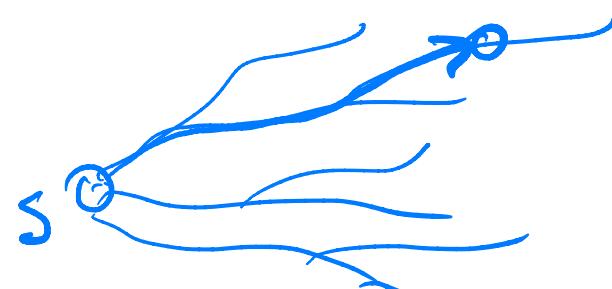

<sup>a</sup>See discussion on *blue edges* later.

<https://eduassistpro.github.io/>

### Dijkstra's Algorithm: Adding Edges (1/3)

#### Assignment Project Exam Help

- Finds the shortest path from the node  $s$  to all other nodes in a weighted graph.
  - Similar to BFS, except that it keeps track of a distance  $d(j)$  (length of the shortest path known so far to node  $j$  from a “root node”  $s$ ) for each node  $j$ .
- Instead of examining them by the distance  $d$  and picking the node  $i$  with the smallest  $d(i)$ , whose distance  $d(i)$  is updated, and updates tentative distance  $d$  for all its neighbors.
- The algorithm uses a heap to keep track of its unvisited nodes  $j$ , each with a metric  $d(j)$ .

<https://eduassistpro.github.io/>

## Dijkstra's Algorithm: Forming a Heap (2/3)

### Assignment Project Exam Help

- Removing the item with small  $O(\log n)$  time if the heap<sup>a</sup> contains  $n$  items
  - If an item's metric changes but it remains in the heap, it takes  $O(\log n)$  time to adjust its position in the heap.
  - Initializing a heap of  $n$  items takes  $O(n)$  time.
- Nodes no longer in the heap<sup>a</sup> have shortest path  $d(j)$  is the shortest path from  $s$  to  $j$ .
  - The shortest path can be traced back from  $j$  to  $s$  by walking the tree from  $j$  to its parent  $p(j)$ , then to  $p(p(j))$ , and so on until reaching  $s$ .

---

<sup>a</sup>A tree-based data structure satisfying the heap property. In a max heap, for any given node  $C$ , if  $P$  is a parent node of  $C$ , then the key (the value) of  $P$  is greater than or equal to the key of  $C$ . In a min heap, the key of  $P$  is less than or equal to the key of  $C$ .

<https://eduassistpro.github.io/>

### Dijkstra's Algorithm: Intuition (3/3)

#### Assignment Project Exam Help

- Nodes in heap have not been visited.  $d(j)$  is tentative.
  - They split into two kinds of nodes: those with finite  $d$  (discovered in the frontier), and those with infinite  $d$  (undiscovered).
  - Each node in the frontier is incident to at least one edge from the visited set.
  - The node in the frontier with the smallest  $d(j)$  has a very useful property on which the algorithm relies:  $d(j)$  is the true shortest distance of the path from  $s$  to  $j$ .
- The algorithm selects this node and then updates its neighbors as  $j$  moves from the frontier into the set of visited nodes.
- Algorithm finds the shortest path from  $s$  to all other nodes in  $O((|V| + |E|) \log |V|)$  time; asymptotic time can be reduced with a Fibonacci heap; in practice a conventional heap is faster.

<https://eduassistpro.github.io/>

## Dijkstra's Algorithm: Formally Assignment Project Exam Help

- $N$  set of all the nodes in (undirect Add WeChat edu\_assist\_pro)
- $l(i, j)$  (non-negative) cost ass e  $\{i, j\}$ .
  - $l(i, j) = +\infty$  if there is no edge between  $i, j$ .
- Let  $s$  be the node executing the algorithm in order to find shortest paths fro ork.
  - $s$  is the start on <https://eduassistpro.github.io/>
- Algorithm constructs incrementally  $M$  of nodes:
  - $M$  is the set of nodes incorporated so far, and
  - algorithm stops when  $M = N$ .
- $C(n)$  is the cost of the path from  $s$  to node  $n$ .

<https://eduassistpro.github.io/>

## Dijkstra BFS: Constructing the Routes (2/2)

### Assignment Project Exam Help

repeat

#### Add WeChat edu\_assist\_pro

1. The root starts phase  $p$  “start  $p$ ” within  $T_p$ .
2. When receiving “start  $p$ ” a leaf node  $u$  of  $T_p$  (that is, a node that was newly discovered in the last phase) sends a “join  $p + 1$ ” message to all quiet neighbors. (A neighbor  $v$  is quiet if  $u$  has not yet “talked” to  $v$ .)
3. Node  $v$  receives the “join  $p + 1$ ” message and replies with ACK and becomes a leaf of the tree  $T_{p+1}$ . (It can decline \*/ or accept the request.)
4. The leaves of  $T_p$  collect all the answers of their neighbors; then the leaves start an echo algorithm back to the root.
5. When the echo process terminates at the root, the root increments the phase.

until there was no new node detected

<https://eduassistpro.github.io/>

## Analysis of Dijkstra BFS Assignment Project Exam Help

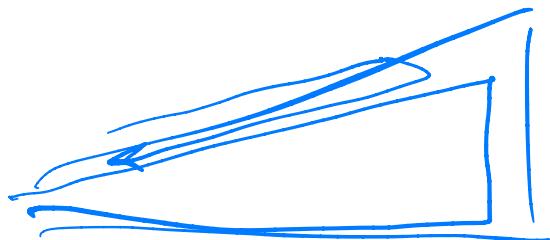

- **Theorem 1** In Dijkstra's algorithm
  - the time complexity is  $O(n^2)$
  - the message complexity is  $O(m + nD)$ ,

where  $D$  is the diameter of the graph,  $n$  the number of nodes,<sup>a</sup> and  $m$  the number of edges. Adjusting the position of an element (vertex)  $i$  is  $O(\log n)$ .

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

$$1 + \dots + k + (k+1) + (k+2) + \dots + D$$

---

<sup>a</sup>Note that earlier we used  $V$  for the number of nodes; here we use  $n$ .

<https://eduassistpro.github.io/>

## Analysis of Dijkstra BFS Assignment Project Exam Help

- Time Complexity
  - A broadcast/echo algorithm needs at most time  $2D$ .
  - Finding new neighbors at the leaves costs 2 time units.
  - Since the BFS tree height is bounded by the diameter, we have  $D$  phases, giving a total time complexity of  $O(D^2)$ .
- Message Complexity
  - Each node participates at most 1 message and sends (echoes) at most 1 message.
  - There are  $D$  phases, so message cost is bounded by  $O(nD)$ .
  - On each edge there are at most 2 “join” messages.
  - Replies to “join” request are answered by 1 “ACK/NACK” (so we have at most 4 additional messages per edge).
  - Message complexity is  $O(m + nD)$ . Processing using the heap costs a factor  $O(\log n)$ .

<https://eduassistpro.github.io/>

## Applications: RIP and BGP Assignment Project Exam Help

- A distributed variant of the Bellman-Ford algorithm is used in distance vector routing protocols like the Routing Information Protocol (RIP).  
<https://eduassistpro.github.io/>
- The algorithm is distributed and involves a number of nodes (routers) within an Autonomous System (AS), a collection of IP networks typically following steps:
  1. Each node calculates distances between nodes within the AS and stores this information as a table.
  2. Each node sends its table to all neighboring nodes.
  3. When a node receives distance tables from its neighbors, it calculates the shortest routes to all other nodes and updates its own table to reflect any changes.

## Questions in Graph Search Assignment Project Exam Help

- When you ask your smartphone for the shortest route from Ottawa to Vancouver, how does it know you cannot do that?
- If you ask it to help you drive from Ottawa to Paris, how does it know you cannot do that?

## Assignment Project Exam Help

- If you post something on Facebook, how does your friends find it?
- These questions can all be posed in terms of search (also called graph traversal).

<https://eduassistpro.github.io/>

## Graph Representation Assignment Project Exam Help

- For an unweighted graph  $n$  nodes, storing a binary adjacency matrix  $A = (a_{ij})$  memory works well in a graph traversal algorithm if the graph is small or if there are edges between many of the nodes.
  - In this matrix  $A = (a_{ij})$ ,  $a_{ij} = 1$  if  $\{i, j\}$  is an edge.
  - With edge weights, a weighted matrix can represent the weight of the edge. Although this assumes that in the problem at hand an edge with zero weight is the same as no edge at all.

<https://eduassistpro.github.io/>

Example Graph Representation  
**Assignment Project Exam Help**

- A graph and its adjacency matrix

[Assignment Project Exam Help](#)

<https://eduassistpro.github.io/>

Add WeChat [edu\\_assist\\_pro](#)

<https://eduassistpro.github.io/>

## Graph Representation Assignment Project Exam Help

- A road network can be represented as a directed graph, with each node an intersection and each edge a road between them.
- The graph is directed because some roads are one-way, and it is unconnected because you cannot drive from Ottawa to Paris.
  - The edge weight  $w_{ij}$  along the road from  $i$  to  $j$ ;
  - all edge weights must therefore be greater than or equal to zero<sup>a</sup>
- An adjacency matrix works well for a single small town, but it takes too much memory for the millions of intersections in the North American road network.

---

<sup>a</sup>There are situations where negative weights are natural to use.

<https://eduassistpro.github.io/>

## Graph Representation Assignment Project Exam Help

- Fortunately, only a handful of nodes have edges pointing to any one node, and thus the adjacency matrix is sparse.
- This kind of matrix or graph is best represented with adjacency lists, where each node  $i$  has a list of nodes  $j$  that it is adjacent to, along with the weights of the corresponding edges.

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

<https://eduassistpro.github.io/>

## Assignment Project Exam Help

- Searching a graph from a single source  $s$ , discovers all nodes reachable from  $s$  in the graph.
- Nodes are marked when visited, so to search the entire graph, a single-source algorithm can be repeated by starting a new search from each node in the graph, ignoring nodes that have already been visited.
- The graph traversal then performs actions on the visited nodes, and also records the order in which the graph was traversed.
- Often, only a small part of the graph needs to be searched.
- This can greatly speed up the solution of problems such as route planning.

<https://eduassistpro.github.io/>

## Spanning Trees Assignment Project Exam Help

- A spanning tree of a graph is a subgraph that is a tree (i.e., contains no cycles) and includes all of the nodes of the graph
- If the edges of the network are weighted (e.g. representing average delay or cost), a minimum weight spanning tree is one that has the lowest total weight.  
<https://eduassistpro.github.io/>
- Two non-distributed algorithms for computing MST:
  - Prim's algorithm
  - Kruskal's algorithm
- A distributed algorithm for computing MST:
  - GHS (Gallagher, Humblet, Spira).

---

<sup>a</sup>Local Area Network.

<https://eduassistpro.github.io/>

## Spanning Tree Terminology Assignment Project Exam Help

- $G = (V, E)$  is an undirected graph
  - $V$  is the set of nodes (vertices)
  - $E$  is the set of edges
- $w_{i,j}$  is the weight of the edge  $\{i, j\}$   $w_{i,j} \geq 0$
- A *spanning tree* is an acyclic subgraph containing all nodes
- Weight of a tree

<https://eduassistpro.github.io/>

$w(T) = \sum_{\{i,j\} \in E(T)} w_{i,j}$

where  $E(T)$  is the set of edges in  $T$ .

- MST (Minimum weight Spanning Tree) is a ST (Spanning Tree) of minimum weight

$$\min_T w(T)$$

<https://eduassistpro.github.io/>

## Two Basic Sequential Spanning Tree Algorithms Assignment Project Exam Help

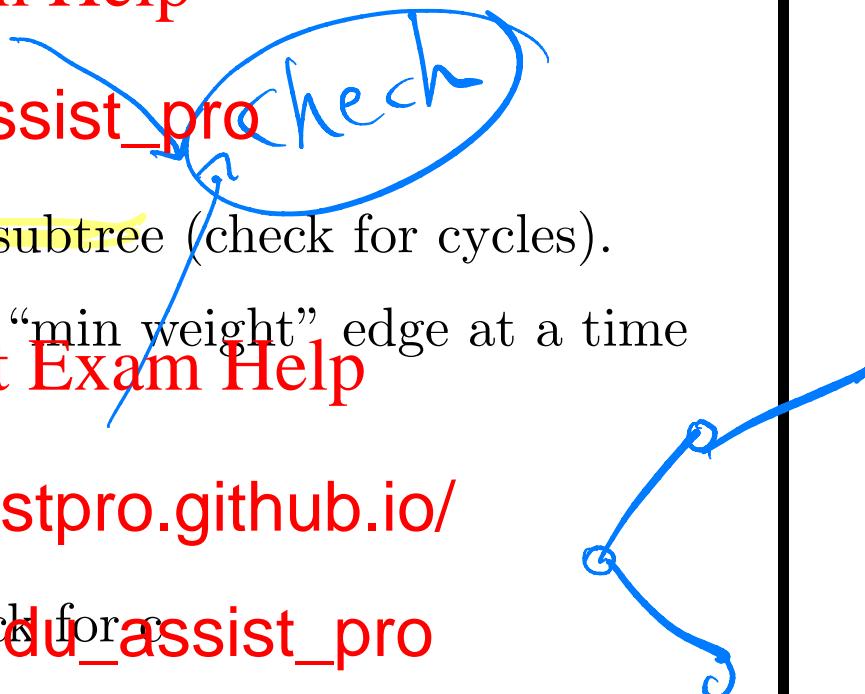

### 1. Prim's Algorithm (Jarnik, 1930)

- Start from any root node.
- Always maintain a connected subtree (check for cycles).
- Among possible choices add a “min weight” edge at a time

### 2. Kruskal's Algorithm

- Sort the edges
- Always maintain a forest (check for cycles)
- Add edges in order as long as no cycles created

Both are centralized

<https://eduassistpro.github.io/>

## Prim's Algorithm (Jarnik, 1930)<sup>a</sup>

### Assignment Project Exam Help

- Prim's Algorithm

- $P$  is current set of nodes in tree

- $D_i$  is min weight edge from node  $i$  to a node in  $P$

- Initially  $P = \{1\}$  and  $D_i = w_{i,1}$  if  $\{i, 1\}$  exists,  $\infty$  otherwise

1. Find  $i \notin P$

2.  $P = P \cup \{i\}$

3. For  $j \notin P$ ,  $D_j = \min\{D_j, w_{j,i}\}$

4. Go back to 1

Can be implemented in  $O(|E| + |V| \log |V|)$  time. See example in appendix.

## Distributed MST Algorithm Assignment Project Exam Help

- Given a graph  $G$ , the goal is to find a minimum spanning tree algorithm that always terminates, and computes the MST of  $G$ .  
<https://eduassistpro.github.io/>
- At the end of an execution, each processor knows which of its incident edges belong to the MST and which do not (i.e. the processor writes in a local output register the corresponding incident edges).  
<https://eduassistpro.github.io/>
- In the distributed version of the MST, a communication network is solving a problem where the information is exchanged locally among the processors themselves.<sup>a</sup>
- This is one of the fundamental starting points of (distributed) network algorithms.

---

<sup>a</sup>A “local” version of the MST is not possible: We won’t discuss this here.

<https://eduassistpro.github.io/>

## Main Idea: Select Assignment Project Exam Help

- Recall

Add WeChat [edu\\_assist\\_pro](https://eduassistpro.github.io/)

## Assignment Project Exam Help

(a) is a tree,

1. Start with trivial spa <https://eduassistpro.github.io/>  $n$  individual nodes and no edges; at the start each vertex <https://eduassistpro.github.io/>  $i$  has weight  $w_i = \infty$ .  
Add WeChat [edu\\_assist\\_pro](https://eduassistpro.github.io/)
2. Repeatedly do the following: Select
  - (a) an arbitrary component  $C$  (i.e., tree) in the forest, and
  - (b) an arbitrary outgoing edge  $e \in C$  having minimum weight among the outgoing edges of  $C$ .

Assignment Project Exam Help

<https://eduassistpro.github.io/>

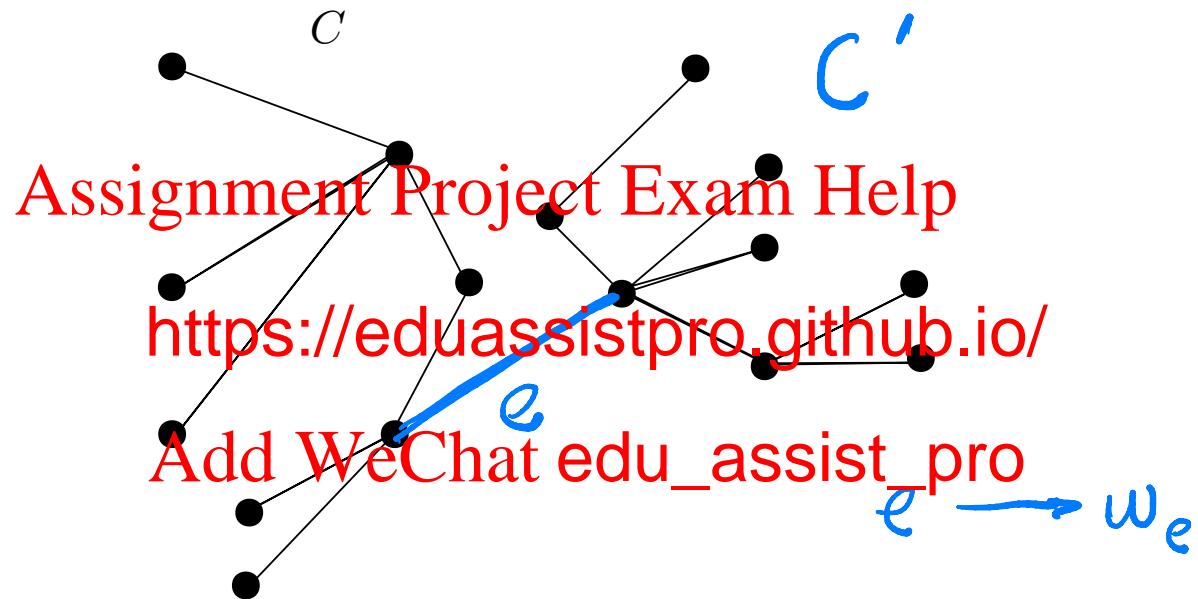

Add WeChat edu\_assist\_pro

<https://eduassistpro.github.io/>

## Main Idea: Merge Assignment Project Exam Help

- For such an edge  $e$ , combine component at the other end of  $e$ , including edge  $e$ , into a single component.

- Stop when the forest has a single component.

Merge  $C \& C'$

<https://eduassistpro.github.io/>

## Assumptions Assignment Project Exam Help

- Now we investigate how to design an algorithm.
- We assume that no two edges of the same weight.
  - This simplifies the problem.
  - simplification.
  - one can always assign weights to the vertices to the weight.

Assignment Project Exam Help

Assume weights are

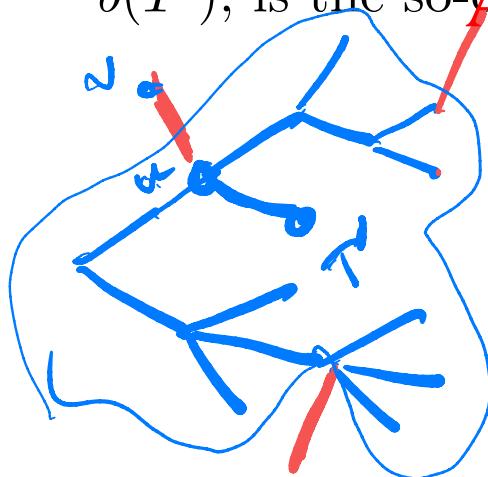

pairwise different!

Otherwise : tag  $\langle ID_u, w_{\{u,v\}} \rangle$

<https://eduassistpro.github.io/>

## Concept of Blue Edges Assignment Project Exam Help

- Let  $T$  be a spanning tree of the graph  $G$   
 – A subgraph  $T' \subseteq T$  of  $G$ .
- Edge  $e = \{u, v\}$  is an outgoing edge of  $T'$  if either
  - $u \in T'$  and  $v \notin T'$  or
  - $u \notin T'$  and  $v \in T'$
- The minimum weight edge of  $T'$ , denoted by  $b(T')$ , is the so-called blue edge of  $T'$ .

$$\overline{T}' \subseteq \overline{T}$$

$$\{u, v\}$$

$b(T')$   
blue edge  
red

<https://eduassistpro.github.io/>

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- Example 2:

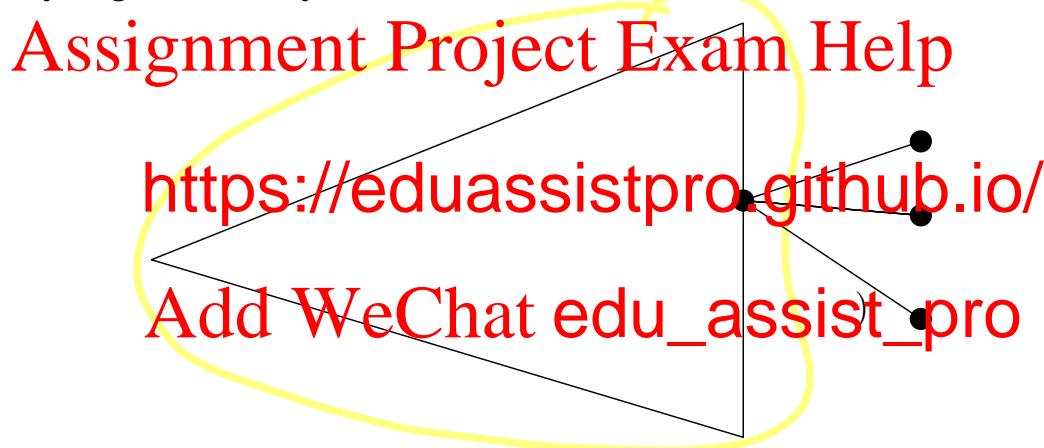

Add WeChat edu\_assist\_pro

<https://eduassistpro.github.io/>

## A Lemma on Adding Blue Edges Assignment Project Exam Help

- **Lemma 1** For a given weighted graph  $G$  (such that no two weights are the same),  
**Add WeChat edu\_assist\_pro**
  - let  $T$  denote the MST, and
  - $T'$  be a fragment of  $T$ .

Then the blue edge of  $T'$  (denoted by  $b(T')$ ) is also part of  $T$ ,

- i.e.,  $T' \cup \{b(T')\} \subseteq T$ .
- So, the Lemma says that blue edges can be added to an already constructed MST fragment and maintain the MST property.

<https://eduassistpro.github.io/>

## Proof of Lemma 1 Assignment Project Exam Help

- For the sake of contradiction, suppose there is edge  $e \notin b(T)$  connecting  $e$  to the remainder of  $T$ .
- Adding the blue edge  $b(T')$  to the MST  $T$  we get a cycle including both  $e$  and  $b(T')$ .  
Assignment Project Exam Help e  $\rightarrow$   $w_b(T')$
- If we remove  $e$ 
  - we still have a spanning tree  $T'$  with weight  $w_{T'} < w_T$ .
  - since by the definition of the blue edge  $w_e > w_{b(T')}$ , the weight of that new spanning tree is less than the weight of  $T$ .<sup>a</sup>
- We have a contradiction.

---

<sup>a</sup>Here we used the fact that the edge weights are different!

<https://eduassistpro.github.io/>

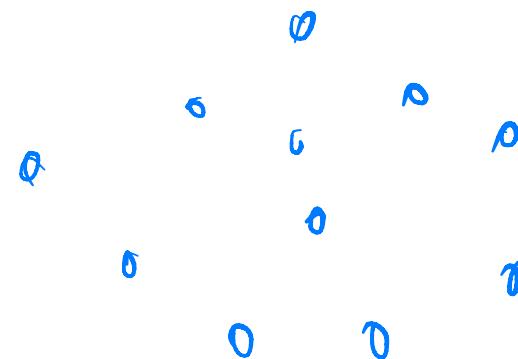

## Assignment Project Exam Help

### Issues

- Blue edges
  - allow a fragment to grow in a graph
  - seems to be the key to a “distributed algorithm” for the “distributed MST” problem.

## Assignment Project Exam Help

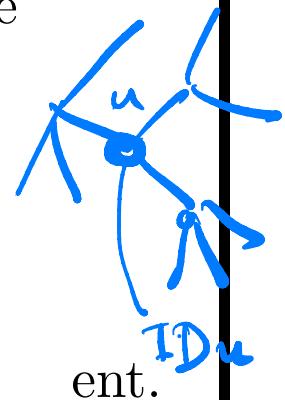

- Since every node it directly has a blue edge
- All we need to do now is to grow these fragments
  - Essentially this is a distributed version of Kruskal’s sequential algorithm.

<https://eduassistpro.github.io/>

## A Distributed Algorithm Assignment Project Exam Help

- At any given time the nodes of the graph are partitioned into fragments (rooted subtrees of the tree).
- Each fragment has a designated vertex called root (of the fragment):
  - ID of fragment is defined to be the ID of its root.
- In the course of the algorithm
  - each node knows its parent and its children.
- The algorithm operates in phases.
- At the beginning of a phase, nodes know the IDs of the fragments of their neighbor nodes.

<https://eduassistpro.github.io/>

## SynGHS (Gallager, Humblet, Spira) Assignment Project Exam Help

- The algorithm builds the components “ (or phases).
- For each  $k$ , the level  $k$  components constitute a spanning forest, where each level  $k$  component consists of a tree that is a subgraph of the MST.

## Assignment Project Exam Help

- Each level  $k$  consists of  $k$  trees.
- Each component is a tree under node.
- The processes allow a fixed number of rounds  $O(n)$ , to complete each level.

<https://eduassistpro.github.io/>

## SynGHS: Base and Inductive Steps Assignment Project Exam Help

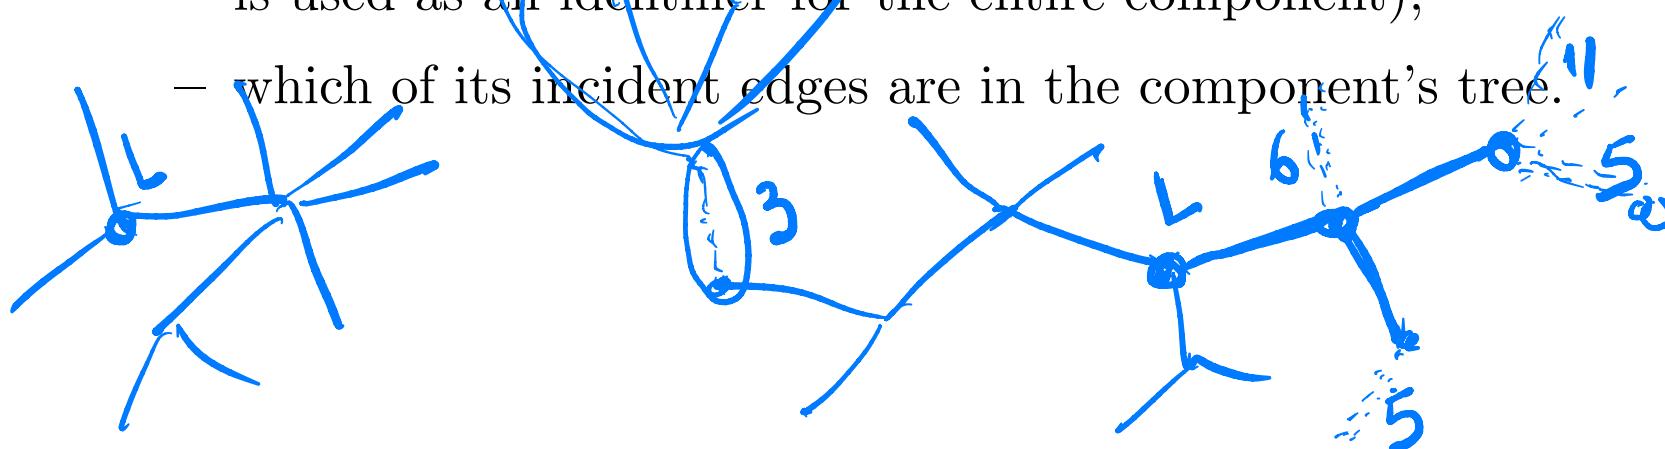

- **Base Step:**

The algorithm starts with level 0 consisting of individual nodes and no edges.

- **Inductive Step:**

Suppose inductively that the level  $\kappa$  components have been determined (also, suppose that each p

- the UID (User ID) of the leader of its component is used as an identifier for the entire component),
- which of its incident edges are in the component's tree.

<https://eduassistpro.github.io/>

## SynGHS: Inductive Step $k \rightarrow k + 1$ Assignment Project Exam Help

- To get the level  $k + 1$  component, the  $k$  component conducts a search along its span for the MWOE (Minimum-Weight Outgoing Edge)<sup>a</sup> of the component.
- The leader broadcasts search requests along tree edges, using a message broadcast strategy (BFS).
- Each process finds the minimum weight that is outgoing from the component (if there is any such edge),
  - it does this by sending test messages along all non-tree edges, asking whether or not the other end is in the same component.

---

<sup>a</sup>Recall that we called such edges: “blue” edges of the fragment.

<https://eduassistpro.github.io/>

## SynGHS: Inductive Step $k \rightarrow k + 1$ Assignment Project Exam Help

- Then the processes convergec -weight edge information toward the leader [Add WeChat edu\\_assist\\_pro](https://eduassistpro.github.io/) a along the way).
- The minimum obtained by the leader is the MWOE<sup>a</sup> of the entire component.
- When all level WOEs, the components are <https://eduassistpro.github.io/> form the level  $k + 1$  components.
  - This involves the leader of each level component communicating with the component process adjacent to the MWOE, to tell it to mark the edge as being in the new tree;
  - the process at the other end of the edge is also told to do the same thing.

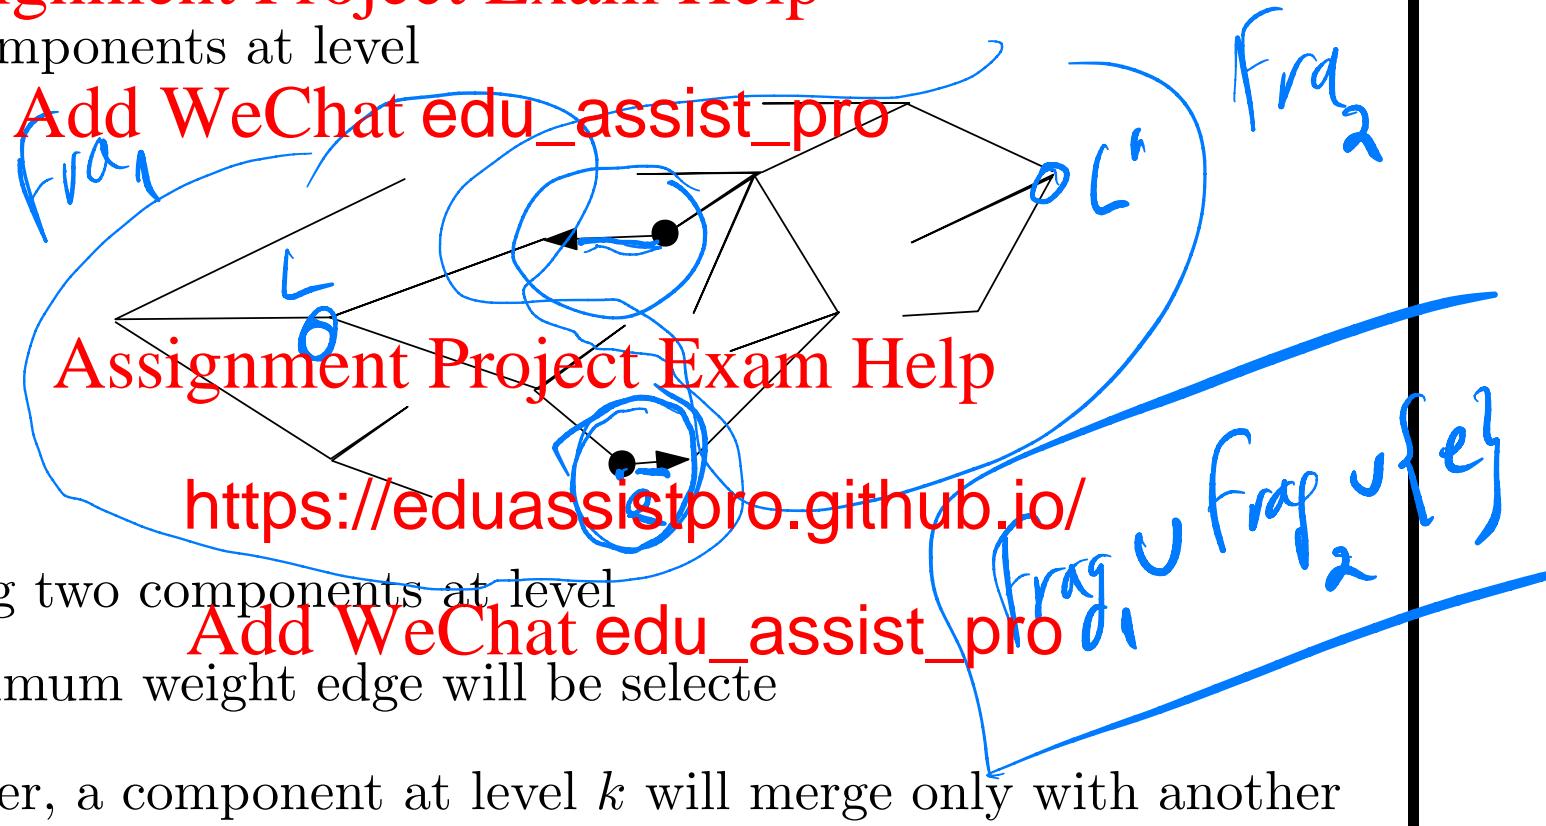

---

<sup>a</sup>I.e., “blue” edge

<https://eduassistpro.github.io/>

## SynGHS: New Leader Assignment Project Exam Help

- Two components at level

- Merging two components at level  
**Add WeChat edu\_assist\_pro**  
– minimum weight edge will be selected
- Moreover, a component at level  $k$  will merge only with another component at level  $k$  which corresponds to a minimum weight outgoing edge!

<https://eduassistpro.github.io/>

## SynGHS: New Leader Assignment Project Exam Help

- Then a new leader is chosen for each  $k + 1$  component, as follows. **Add WeChat edu\_assist\_pro**
  - It can be shown that for each group of level  $k$  components that get combined into a single level  $k + 1$  component, there is a unique edge  $e$  that is the common MWDE of two of the level  $k$  components<sup>a</sup>.
  - New leader: is the node with the larger UID.
  - **NB:** this new leader can identify its information available locally.
- Finally, the UID of the new leader is propagated throughout the new component, using a broadcast.

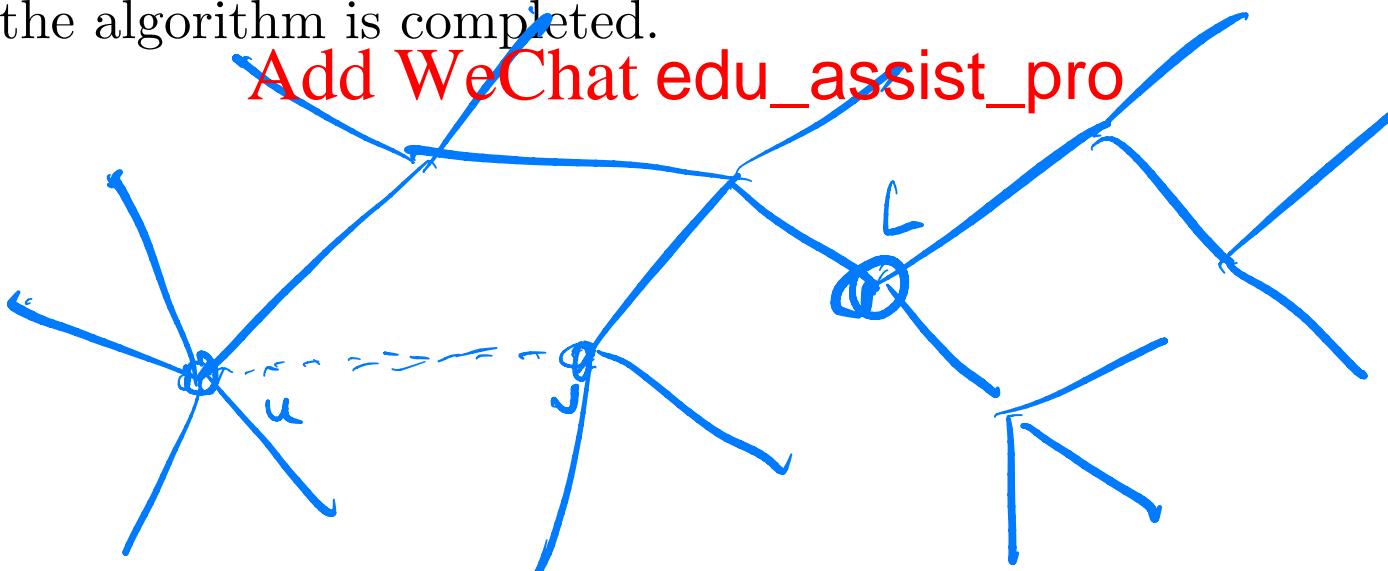

---

<sup>a</sup>Recall that edge weights are pairwise distinct.

<https://eduassistpro.github.io/>

## SynGHS: Conclusion Assignment Project Exam Help

- Eventually, after some number of steps, the network consists of only a single component.
- Then a new attempt to find a MWOE will fail, because no process will find an outgoing edge.
- When the leader receives a message from a process indicating that the algorithm is completed.

<https://eduassistpro.github.io/>

## A Key Idea of the Algorithm (1/2) Assignment Project Exam Help

- Among each group of level components that get combined, there is a unique (undirected) edge common MWOE of both endpoint components.
  - To see this: consider the **component digraph**  $G'$ , whose nodes are the level  $k$  components that combine to form one level  $k + 1$  component.  $G'$  has exactly one outgoing edge.<sup>a</sup>
  - $G'$  is a weakly connected graph with exactly one outgoing edge.<sup>a</sup>

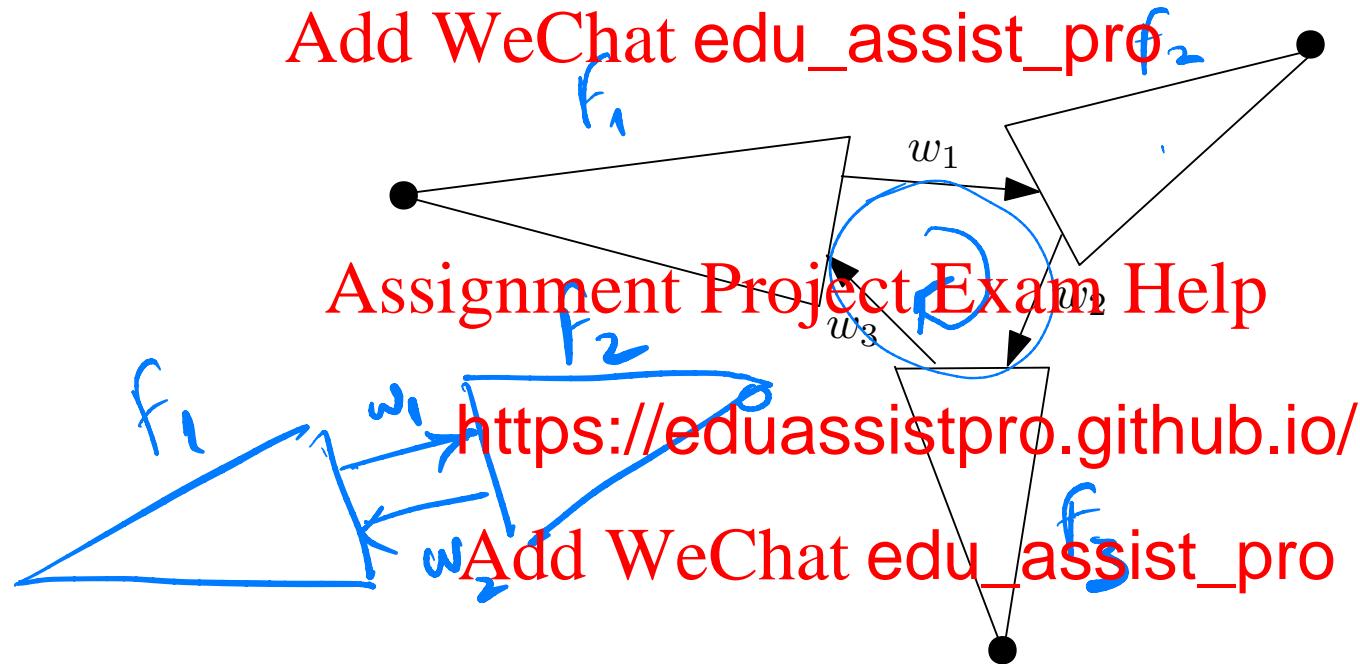

---

<sup>a</sup>A digraph is weakly connected if its undirected version, obtained by ignoring the directions of all the edges, is connected.

<https://eduassistpro.github.io/>

## A Key Idea of the Algorithm: Example Assignment Project Exam Help

- Can we have a cycle of length 3 in the component graph?

- If yes then,  $w_1 < w_3$  and  $w_2 < w_1$  and  $w_3 < w_2$ !

$$w_1 < w_3$$

$$w_2 < w_1 \quad w_3 < w_2$$

<https://eduassistpro.github.io/>

## A Key Idea of the Algorithm (2/2) Assignment Project Exam Help

- So we have the following proper

**Lemma 2** *If for a weakly connected graph  $G$  each node has exactly one outgoing edge then  $G$  contains exactly one cycle.*

- We apply Lemma 2 to the component digraph  $G'$  to obtain the unique cycle of components.
- Because of the way massive edges in the cycle must have non-increasing weight the length of this cycle cannot be greater than 2.
- So the length of the unique cycle is exactly 2.
- But this corresponds to an edge that is the common MWOE of both adjacent components.

<https://eduassistpro.github.io/>

## Importance of Synchrony in SynGHS Assignment Project Exam Help

- Synchrony ensures when a process tries to determine whether or not the other endpoint  $j$  is in the same component, both  $i$  and  $j$  have up-to-date component UIDs.
- If the UID at  $j$  is observed to be different from that at  $i$ , we would like to be certain that  $i$  and  $j$  really are in different components, not just in the same component. <https://eduassistpro.github.io/>
- In order to execute the levels synchronously, we need to know a predetermined number of rounds for each computation. To be certain that all the computation for the round has completed, this number will be  $O(n)$ ; note that  $O(diameter)$  rounds are not always sufficient.
- Need to count this number of rounds is the only reason that nodes need to know  $n$ .

<https://eduassistpro.github.io/>

## Complexity Analysis of SynGHS Assignment Project Exam Help

- Note first that the number of nodes in a  $k$  component (with the possible exception of the root) is at most  $2^k$ .
- This can be shown by induction, using the fact that at each level, each component is combined with at least one other component at the same level.
- Therefore, the time complexity of SynchGHS is  $O(n \cdot 2^k)$ .
- Since each level takes time  $O(n)$ , the time complexity of SynchGHS is  $O(n \cdot 2^k)$ .
- The communication complexity is  $O((n + |E|) \cdot \log n)$ , since at each level,  $O(n)$  messages are sent in total along all the tree edges, and  $O(|E|)$  additional messages are required for finding the local minimum-weight edges.

<https://eduassistpro.github.io/>

## Issues: Asynchronous Case Assignment Project Exam Help

- More details are needed for the asynchronous communication model. [Add WeChat edu\\_assist\\_pro](#)
  - It may be that some fragments (subtrees) are much larger than others, and because of that some nodes may need to wait for others, e.g., if node  $v$  needs to find out whether neighbor  $v$  has seen edge  $b = (u, v)$ .

<https://eduassistpro.github.io/>

- These details can be
  - We can bound the asynchronicity by noting that nodes only start the new phase after the last phase is done, similarly to the phase-technique of Dijkstra's Algorithm.
- This gives rise to the idea of levels which will not be discussed any further.

<https://eduassistpro.github.io/>

## Assignment Project Exam Help

- The GHS algorithm is also known as BigMerge.
- The GHS algorithm can be applied as follows.
- GHS for instance directly solves leader election in general graphs: The leader is simply the last surviving root!
- GHS is distributed in that the number of em
- In general, if you restrict the number of nodes to construct a spanning tree.
- There exist constant round algorithms on geometric graphs that construct spanners with good spanning properties.

$u, v$  are adjacent (in a wireless system)

## Application Assignment Project Exam Help

- Construct “local” planar spanner stretch factor in Wireless Networks.
- Here is a simple algorithm.
  1. Each node  $u$  finds its distance 2 neighborhood  $N_2(u)$ .
  2. Each node  $u$  finds the set of its distance 2 neighbors  $N_2(u)$  of its distance 2 neighborhood  $N_2(u)$ .
  3.  $\{u, v\}$  is an edge of the spanner iff  $\{u, v\} \in E$  is an edge of both  $T_u$  and  $T_v$ .
- The resulting spanner is
  1. planar,
  2. has small stretch factor,
  3. requires information from only two hops away.

<https://eduassistpro.github.io/>

## Assignment Project Exam Help

1. Consider the following traversal rule: the initiator sends out a token to discover the traversal path. The initiator sends a node as one from which the token is received for the first time. All other neighboring nodes will be called neighbors. By definition, the initiator does not have a parent. The following two rules define the

- (a) Send the token to its parent.
- (b) If Rule (1a) cannot be used to send the token to its parent,

Show that when the token returns to the root, the entire graph has been traversed by proving the following two claims.

- (a) The token has a valid move until it returns to the root.
- (b) Eventually every node is visited by the token.

---

<sup>a</sup>No to hand in!

<https://eduassistpro.github.io/>

2. Let  $G = (V, E)$  be a directed graph. A maximal strongly connected component of  $G$  is a subgraph  $G'$  such that 1) for every pair of vertices  $u, v$  there is a directed path from  $u$  to  $v$  and a directed path from  $v$  to  $u$ , and 2) no other subgraph of  $G$  has  $G'$  as its subgraph. Propose a distributed algorithm to compute the maximal strongly connected component of a graph.
3. Propose an algorithm for repairing a graph by restoring connectivity when a single node fails. Your algorithm should complete the repair by adding the smallest number of edges. Compute the time complexity of your algorithm.
4. In a spanning tree of a graph, there is exactly one path between any pair of nodes. If a spanning tree is used for broadcasting a message, and a process crashes, some nodes will not be able to receive the broadcast. Our goal is to improve the

<https://eduassistpro.github.io/>

connectivity of the subgraph used for broadcast, so that it can tolerate the crash of one process.

Given a connected graph  $G = (V, E)$ , what is the minimal subgraph you would use for broadcasting, so that messages will reach every process even if one process fails? Suggest a distributed algorithm for constructing such a subgraph. Argue why your algorithm will work, and analyze its complexity.

5. The eccentricity of a vertex  $v$  is the maximum distance from  $v$  to any other vertex. um  
eccentricity form the center.  
  - (a) Show that a tree can have at most two centers.
  - (b) Design a distributed algorithm to find the center of a tree.
6. Given an undirected graph  $G = (V, E)$ , a matching  $M$  is a subset of  $E$ , such that no two edges are incident on the same vertex. A matching  $M$  is called maximal if there is no other

<https://eduassistpro.github.io/>

matching  $M'$  such that  $M \subset M'$ . Suggest a distributed algorithm for computing a maximal matching. When the algorithm terminates, each node  $s$  matching neighbor, if such a match exists.
